Next Step for Rail Shippers: GPS Technology
*BDS and Satamatics Collaborate to Enhance
Railcar Location and Condition Reporting Using GPS Technology*

The Woodlands, TX – July 12 2007 - Bourque Data Systems, Inc. (BDS), the leading rail logistics software provider and Satamatics, a global provider of satellite-based telematics, announced today the successful network integration between the two companies. Working together, they have accomplished integration of Satamatics' Inmarsat D+ satellite communications network with BDS' RAILTRAC® for real-time railcar GPS location and asset monitoring. With several pilot programs underway with large hazardous chemical shippers, Steve Bourque, BDS' President says, *"This robust XML data integration will provide our customers with real-time railcar location and asset monitoring data for enhanced security and control"*.

New RAILTRAC® GPS mapping and reporting functions are easy to interpret and will provide a set of robust warning indicators should a shipment fall out of spec. Bourque adds, *"With this new monitoring layer, hazardous material shippers can exert control and security to a new level and fulfill upcoming US government compliance regulations for TIH & PIH shipments"*.

With this integration, Satamatics and BDS will be able to deliver true visibility of hazardous material carrying railcars and better serve the chemical industry. *Brian Hester, President and COO of Satamatics Inc, said "Being able to locate a fleet or a single tank car carrying hazardous materials in minutes is an incredible tool in times of crises and is completely within the technical capabilities of both the BDS software and the Satamatics hardware and satellite airtime services. With the equipment smaller than a lunch box, battery life of over five years and real-time polling capabilities on a global basis, this technology has really matured to a point where it's affordable and completely warranted on all hazmat shipments"*.

About Bourque Data Systems, Inc.

Headquartered in The Woodlands, TX, Bourque Data Systems (BDS) has been automating rail shipment processes for shippers since 1989 with the introduction of RAILTRAC®, now the leading rail fleet and shipment management software for rail shippers. BDS provides a full suite of modules to address multi-mode shipment operations, loading and inspection, fleet accounting, freight payment, supply chain, and VMI programs. EDI data services connect suppliers, customers, carriers and vendors. The BDS Logistics group provides professional transportation management support and railcar maintenance management. www.railtrac.com

About Satamatics

Satamatics worldwide telematics services provides end-to-end tracking and monitoring solutions that work anywhere in the world. With over 120,000 terminals operating on its Inmarsat D+ network, Satamatics enables land transport, security, maritime and oil and gas organizations to locate, track and communicate with mobile assets, safeguard their fleets, cargo and personnel, and monitor their fixed and mobile assets in the most hostile or remote terrain across the globe. www.satamatics.com
